

HOW WILL BE THE FOOD SECTOR IN 50 YEARS.

THE KIT ABLE TO PHOTOSYNTHESIS

THE PHOTOSYNTHESIS KIT

This is the Photosynthesis kit.
This is a prototype and can be finish with various designs.

This will be a walking tree, with fashion and has the ability to photosynthesis, and produce energy (ATP).

As a bi-product, the kit is able to produce O_2 .

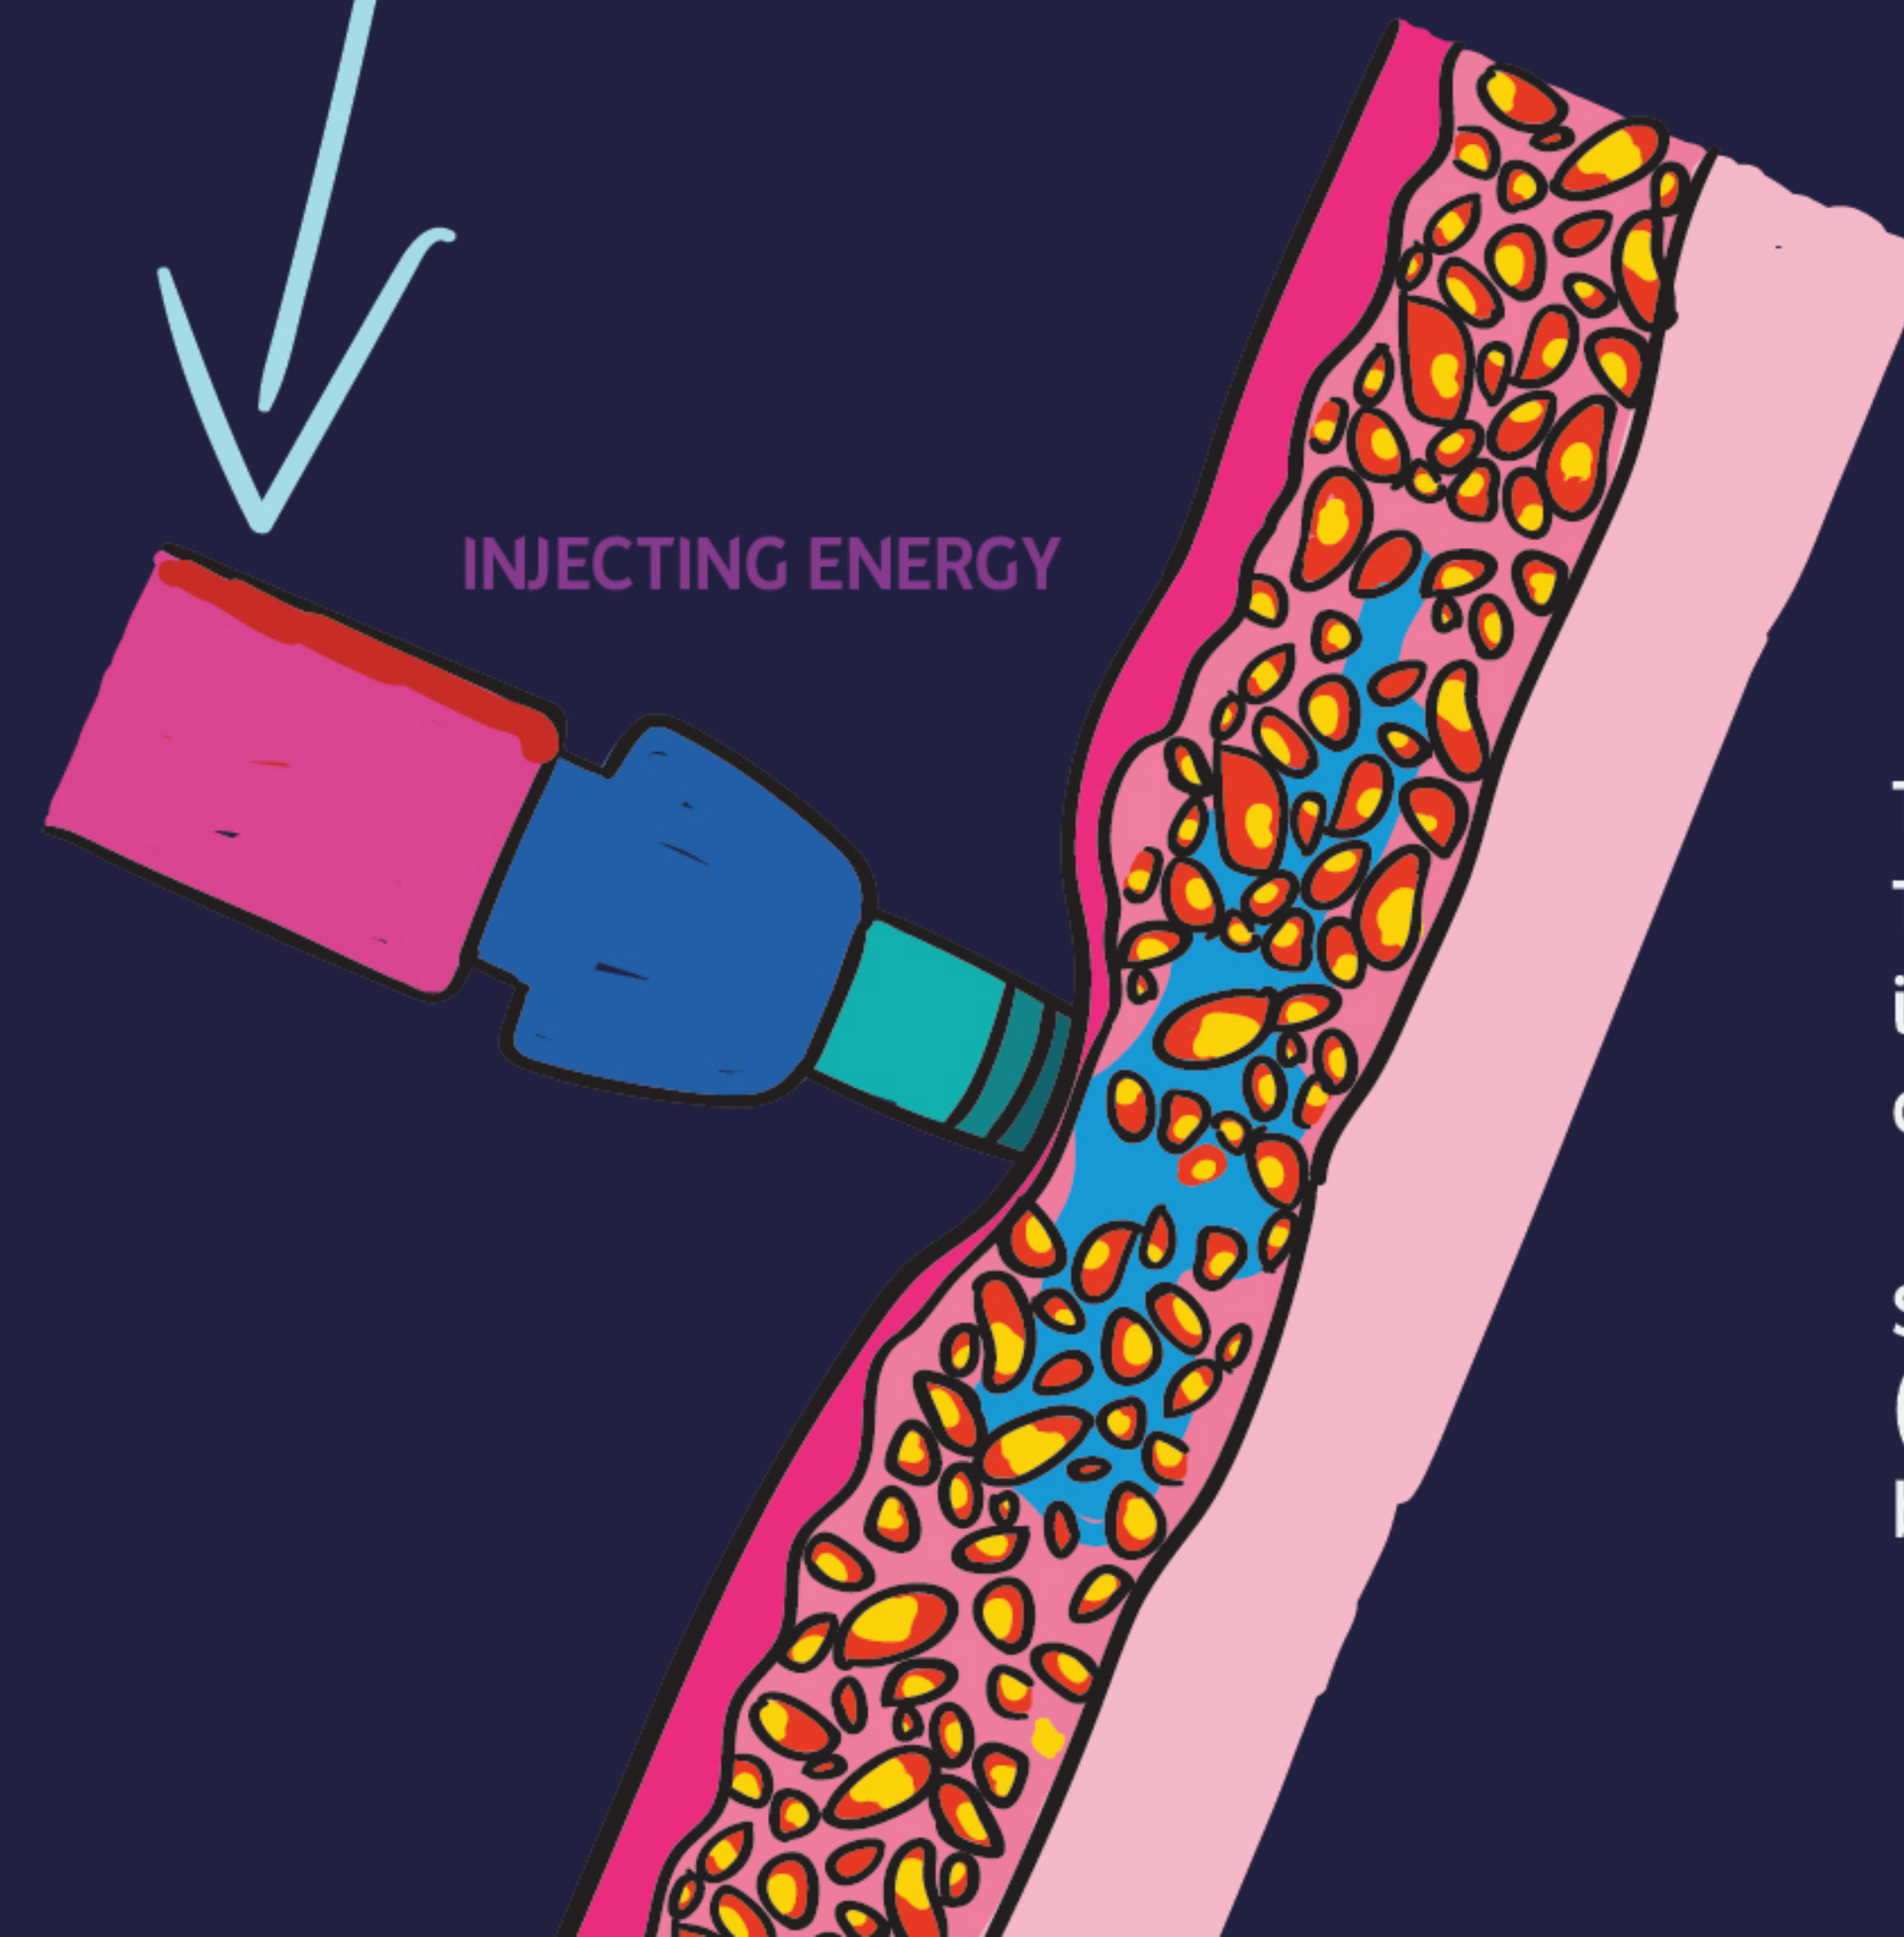

PHOTOSYNTHESIS CELL

This is the Photosynthesis cell.
The kit is integrated with billions of these cells.

The each cell can produce energy (ATP),
(sun light is needed.)

Energy will transfer to the injecting mechanism,
and excess glucose and minerals will collect to
the bottle as a consumable liquid
connected to the smart belt which lies the
Central process unit.

INJECTING ENERGY

This is the injecting mechanism.
The kit consists of needleless micro
injectors which inject energy to the body
cells.

So if someone is lack in with vitamin B,
(as an example) he can choose to have it
by the smart belt.

This kit will produce all the necessary
energy and consumers that a human
needs to be alive and no more external
foods are required.

The kit will minimize number of health
issues like fat, cholesterol, diabetes
and much more.

The kit can produce Oxygen as a
bi-product, which will reduce the
air pollution.

It is a walking tree and with each
human use one it will be 8 billion
more trees to the nature in 2070.

The bottle integrated with
photosynthesis kit, that
store your choice of food
as a liquid.
